Submitted for viva-voce: _____

Internal Examiner **External Examiner**

DECLARATION

I **ASWATHY SALIKUMAR,** Register No:**230021024146**, declare that the project on **"ASSESS PRO-DIGITAL ASSESSMENT AND FORM GENERATOR"** is the result of original work done by me and to the best of my knowledge; a similar work has not been submitted earlier to the Mahatma Gandhi University or any other institution, for fulfilment of the requirement of a course of study. This project report is submitted on partial fulfilment of the requirement for the Degree of Bachelor of Computer Science of Mahatma Gandhi University.

ASWATHY SALIKUMAR

(230021024146)

ACKNOWLEDGEMENT

Each and every moment throughout this project the period of my project work, his unseen hands led us I am indebted to the supreme for the favours I received. I am thankful and loyal to him.

I wish to express my gratitude to **Mr Dr. Thomas K.V** Principal of BCM College, Kottayam for Blessing my endeavour will the permission to set afloat this project work.

I am extremely thankful to **Mrs. Sunila Alexy Mathew**, Head of the Department for her immense help and encouragement during the entire project. I also thank all the faculties of Computer Science Department of BCM College for their sincere co-operation.

I wish to express our gratitude to **Mrs. Soumya Scaria**, internal guide, for her advice, formation and development of the project. We thankful to the Division Manager of **Techlance company, Kottayam**, for allowing us to do the project there and for the valuable guidance and suggestions given by staff at every stage of the project.

I also express my humble gratitude to all our family members and friends who rendered their valuable suggestions and support as a helping hand for our project.

ASWATHY SALIKUMAR

ABSTRACT

The "Mini-Project Report for Assess Pro-Digital Aseessment And Form Generator" utilizes PHP and MySQL to develop a focused application designed specifically for the generation, display, and retrieval of student internal assessment reports. The core objective is to move beyond manual data aggregation and create a swift, accurate platform that outputs structured internal mark statements, particularly for a course's mini-project component.

Currently, the process of communicating internal marks often involves combining data from disparate sources, leading to delays in report issuance, inconsistent formatting, and difficulty for students to access a clear, consolidated view of their performance across different internal metrics (e.g., viva, documentation, presentation).

The proposed system simplifies this reporting pipeline. It uses a MySQL backend to store assessed scores and leverages PHP to dynamically fetch, calculate (if necessary, for subtotals), and present the data. Key features include instructor-side filtering (by student ID or batch), automated formatting of the final mark sheet, and the ability to generate a printable or downloadable report that clearly breaks down the score for the mini-project's internal evaluation. This implementation ensures timely, transparent, and accurate delivery of internal assessment results.

- Automation of Marks Management
- Efficient Record Keeping
- Time Saving
- Data Security

INTRODUCTION

1.INTRODUCTION

The advent of computer technology has simplified academic record management, especially in handling internal examination data such as Form A and Form B. This system is designed to record, calculate, and manage students' internal marks in an efficient and organized manner. It reduces manual errors, saves time, and ensures transparency in the evaluation process. By digitalizing the mark entry and calculation process, the system enhances accuracy and provides a reliable way to maintain student performance records. It allows teachers to generate reports quickly, store data securely, and retrieve information easily. This system not only improves the efficiency of academic assessment but also supports better communication between teachers and students, making the entire process more streamlined and dependable.

ORGANIZATION PROFILE

• 2.ORGANIZATION PROFILE

esQuare was established in 1999 with the objective of providing innovative and reliable customer service solutions through advanced information technology. Since its inception, the company has remained committed to delivering high-quality software products and IT services that meet the dynamic needs of businesses. With a strong focus on innovation and customer satisfaction, esQuare continues to maintain an excellent client retention rate and a reputation for technological excellence.

Vision:

To leverage digital technology to create meaningful and seamless user experiences that drive business growth and operational excellence.

Mission:

To integrate digital competence with industry-specific expertise and provide complete, scalable, and sustainable IT solutions that empower organizations to achieve their goals.

Core Competencies:

• Rapid development of scalable, multi-user, online applications • Strong expertise in content management systems • Proven systems integration and deployment processes • Stable software development environment with experienced professionals

Services Offered:

1. Application Development

Development of native mobile applications for iOS and Android platforms tailored to specific business needs.

2. Enterprise Solutions

Custom software solutions designed to meet the strategic and operational requirements of enterprises.

3. Corporate Identity Design

Design and development of branding elements such as logos, media assets, and corporate stationery.

4. Database Specialist Services

Expertise in the design, development, and implementation of database-driven applications across multiple domains, including:

- Accounting
- Healthcare Management
- Customer Relationship Management (CRM)
- Retail Management Systems
- Employee Management Systems\ Enterprise Resource Planning\(ERP)
- Logistics and Transportation
- Document Management
- Project Management
- Professional Training

Integrated Approach:

esQuare follows a systems integration approach that ensures not only timely development but also the effective deployment of applications. This approach guarantees successful coordination, interface control, planning, and system implementation.

Stable Software Development Environment:

Unlike many other software firms, esQuare has successfully retained its core software professionals over the years. This stability ensures uninterrupted maintenance support and consistent service quality for its clients

SYSTEM ENVIRONMENT

3.SYSTEM ENVIRONMENT

Software Specification

Front End: HTML,CSS,JavaScript

Back End: MySQL, PHP

Hardware Specification

Processor: Intel(R) Core(TM) i7-6820HQ CPU @ 2.70GHz

RAM: 16GB

Hard Disk: 77.4 GB

SOFTWARE FEATURES

4.FEATURES OF SOFTWARE

4.1PHP FEATURES

- PHP stands for Hypertext Pre-Processor.
- PHP is a widely-used open source general-purpose scripting language that is especially suited for web development and can be embedded into html.
- Originally created by Rasmus Lerdorf in 1994.
- PHP code may be embedded into HTML code, or it can be used in combination with various web template systems and web frameworks.
- PHP code is usually processed by a PHP interpreter implemented as a module in the web server or as a Common Gateway Interface (CGI) executable.
- The web server combines the results of the interpreted and executed with a command-line interface (CLI) and can be used to implement standalone graphical applications.

4.2 MYSQL FEATURES

- MySQL is an open-source relational database management system (RDBMS).
- Its name is a combination of “My”, the name co-founder Michael Widenius and “SQL” the abbreviation for structured query language.
- Information in the MySQL database is stored in the form of related tables.
- MySQL database are typically used for web application development.
- A MySQL database can be accessed directly using C, C++, Eiffel, Java, Perl, PHP and Python computer languages.
- There is also third party support for connection in a windows environment.
- MySQL database queried using a subset of the standard structured query language (SQL) commands.

4.3JavaScript:

JavaScript (JS) is a dynamic computer programing language. It is most commonly used as part of web browsers, whose implementations allow client-side scripts to interact with the user, control the browser, communicate asynchronously, and later the document content that is displayed. It is also being used in server-side programing, game development and the creation of desktop and mobile applications. JavaScript is a prototype-based language with dynamic typing and has first-class functions. Its syntax is

influenced by C. JavaScript copies many names and naming conversions from Java, but the two languages are otherwise unrelated and have very different semantics. The key design principles within JavaScript are taken from the self and Scheme programing languages. It is a multi-paradigm language, supporting object-oriented, imperative, and functional programing styles.

4.4 Cascading Style Sheet 3 (CSS 3):

CSS is a style sheet language used to describe the presentation semantics (that is, the look and formatting) of a document written in markup language (Style defines how to display HTML elements). Its most common application is to style web page written in HTML and any kind of XML documents. Cascading Style Sheets (CSS) are widely recognized for their contribution in building fact-loading, standards compliant, easily modifiable web pages. External Style Sheets are stored in CSS file CSS 3 is the latest standards for CSS. CSS 3 is completely backwards-compatible with earlier versions of CSS. The online Alumni Management System uses the CSS3 specifications.

4.5 HTML5

HTML stands for Hyper Text Markup Language.

- A markup language is a set of markup tags.
- HTML markup tags are usually called as HTML tags.
- HTML tags are keywords surrounded by angle brackets like <html>.
- HTML document contain HTML tags and plain text.
- HTML documents are also called as Web Pages.

HTML5 is a core technology markup language of the Internet used for structuring and presenting content for the World Wide Web. As of October 2014, this is the final and complete fifth revision of the HTML standard of the World Wide Web Consortium (W3C). The previous version, HTML 4, was standardized in 1997. Its core aims have been to improve the language with support for the latest multimedia while keeping it easily readable by humans and consistently understood by computers and devices (web browsers, parsers, etc.).

SYSTEM ANALYSIS

5.SYSTEM ANALYSIS

5.1 INTRODUCTION

System Analysis is the application of the systems approach to problem solving using computers. The ingredients are system elements, processes and technology. This means that to do systems work, one need to understand the system concept and how organizations operate as a system, and the design appropriate computer based systems that will meet an organization's requirements. It is actually a customized approach to the use of computer for problem solving.

PRELIMINARY INVESTIGATION

Initial investigation is the activity that determines whether the user's requisition is valid and feasible. The first step in initial investigation is the problem definition. It includes the identification of the problem to be solved. for the task to be accomplished and the system goals to be achieved.

EXISTING SYSTEM

Now a day we do all work with computerized system but with current system is very complicated to keep track of all registers and handle them manually. As well as this work is time consuming and also expensive. In this system report work may not be not accurate and not faster. It will be more stationary. Display multiple reports, searching problems of all registers etc.

PROPOSED SYSTEM

In proposed system, the management needs not to keep any type of registers which they use to keep in old one. They have work only with one computer. All the details are stored in computer files. The dual entries are done very quickly as entry in one file only, affects the other file where it has to record. In the way there is no need to record the computer operator.

The working through registers system is not only very laborious and time consuming, but there are number of errors found. In comparison to old system the proposed system of computer possess many advantages. It is accurate, secure, time saving, perform repetitive task very well, low cost, easy maintenance and modifications and attractive etc.

5.2 DATA FLOW DIAGRAM

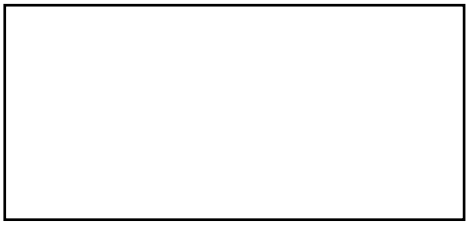
Data flow diagram first which shows the interaction between the system and outside entities. The DFD is designed to show how a system is divided into smaller portions and to highlight the flow between those parts. The context level data flow diagram are then "exploded" to show more details of the system being modelled Data Flow Diagram (DFD) is a graphical representation of the "flow" of data through an information system. A data flow diagram can also be used for the visualization of data processing. It is common practice for designer to draw a context level flow diagrams were invited by Larry Constantine, the original developer of structured design, based on Martin and Estrin's "data flow diagrams" model of computation.

RULES FOR CONSTRUCTING A DATA FLOW DIAGRAM

- Arrows should not cross each other
- Squares, Circles and Files must bear names
- Decomposed data flow squares and circles can have same name
- Choose meaningful names for data flow
- Draw all data flows around the outside of the diagram

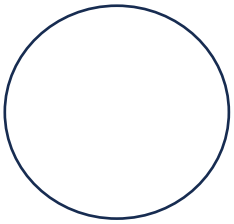
BASIC DATAFLOW SYMBOLS

- A Rectangle defines a source (originator) or destination of system data.

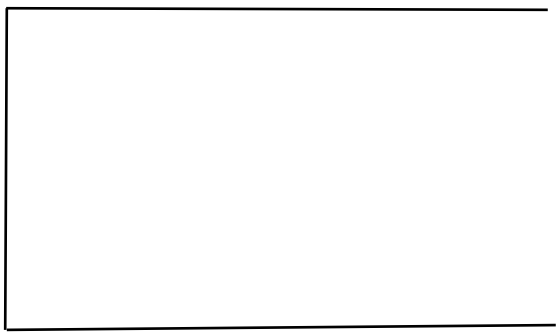


- An arrow identifies data flow of data in motion. It is a pipeline through which information flows.

- Circle or Bubble represents a process that transforms incoming data flows into outgoing data flows.



- An open rectangle is a data source



5.3 FEASIBILITY STUDY

The Feasibility study is carried out to determine whether the proposed system can be developed with available resources. A Feasibility study is the test of a system proposal according to workability, impact on the organization, ability to meet your needs and effective use of resources. Working with the existing system is quite tiresome when considering the merits of the new system. The results of feasibility study are given below.

- **ECONOMIC FEASIBILITY**

Economic Feasibility is the most frequently used method for evaluating the effectiveness of the candidate system. More commonly known as cost/benefit analysis, the procedure is to determine the benefits and saving that are expected from a candidate system and compare them with costs.

- **TECHNICAL FEASIBILITY**

Technical Feasibility centers on the existing computer system and to extent it can support the proposed addition. Here is the proposed system is considered technically feasible.

- **OPERATIONAL FEASIBILITY**

The system operation is the longest phase in development life cycle of a system. So, operation feasibility should be given much important. The user of the system don't need through training on the system. All they are expected to know to operate the system is the basic net surfing knowledge. It is a user friendly interface.

- **BEHAVIORAL FEASIBILITY**

The user are presented with a friendly user interface that helps them to understand the flow of existing system more easily. The operation cost is bearable. The maintenance and working of the new system needs less effort. The proposed project is beneficial to the organization and its user friendly.

5.4 MODULE DESCRIPTION

The user modules are:

- **Login: This module is used to login**
- Register: This module can be used to enter details of the user.
- Booking: Used to book movie through the website
- Histrory: user can view the booking history in the profile

The admin modules are:

- Login: this module is used to login
- Movie: Through this module we can add new upcoming movie news
- Theatre: Through this module we can add new theatre and its details

The Theatre Module are:

- Login: Theatre assistant can login
- Theatre: To add theatre details ,add screen and show time
- Add movie: add new movie to theatre
- Show: add shows to theatre
- Bookings: theatre assistant can view todays bookings

SYSTEM DESIGN

6. SYSTEM DESIGN

System design involves the detailed design of the system selected in the system study phase.

6.1 INPUT DESIGN

Input design is the process converting user oriented input in to computer based format. Inputs are the source of data for processing. Incorrect data input cause error in data manipulation. During input design phase the input should be designed in such a manner so as to control error entered by data entry operation.

Four objectives guiding the design of input focus on:

- Controlling the amount of input requirement
- Avoiding delay
- Controlling errors
- Keeping the steps simple

Input design objective:

- To produce a cost effective method of input
- To achieve the high level of accuracy
- To ensure that the input is acceptable to and understand by the user

6.2 OUTPUT DESIGN

Computer output is the most important and direct source of information to the user. Output design is a process that involves designing necessary outputs in the form of reports that should be given to various users according to their requirements, efficient, intelligible, output design should improve the system's relationship with the user and help in decision making. Since the reports are directly referred by the management for taking decisions and to draw conclusions, they must be designed with at most care and details in the report must be simple, descriptive and clear to the user.

A major form of output is a hard copy from printer. So while designing output the following things are to be considered.

- Determine what information are present
- Arrange the presentation of information in an acceptable format
- Decide how to distributive the outputs to intended receipts
- Depending on the nature and future use of output required, they can be displayed on the monitor for immediate and for obtaining the hardcopy

6.3 DATABASE DESIGN

A database system provides the organization with the centralized control of its data. This is in sharp control to the situation that prevails in many enterprises, where typically each application pass its own private files in its own tapes and disks so that the data is widely dispersed and therefore, difficult to control the flow.

The advantage of Centralized database is:

- Redundancy can be reduced
- Integrity can be maintained
- Inconsistency can be avoided
- Security restrictions can be enforced
- Data can be shared

6.4 NORMALIZATION

After the conceptual level, the next level of process of database design is to organize the database design to organize the database structure into a good shape called Normalization. The Normalization simplifies the entries, removing redundancies form the system data and family builds a data structure, which is both flexible and adaptable to the system. The different normal forms obtained during the database design are given below:

- First Normal Form (INF)
- Second Normal Form (2NF)
- Third Normal Form (3NF)

First Normal Form (1NF)

A relation is said to be in first normal form if and only if it satisfies the constraints that contain the primary key.

Second Normal Form (2NF)

A relation is said to be in second normal form if and only if satisfies all the first normal conditions for the primary key and every non primary key attributes of the relation is fully dependent on its primary key alone.

Third Normal Form (3NF)

A relation is said to be in third normal form if and only if it is in normal form and move over the non key attributes of the relation should not be depend on other non-key attributes

6.5 CODE DESIGN

The main purpose of code is to facilitate the identification and retrieval if information. A code is an ordered collection of an entity or attribute. Coding translates the detailed design representation of software into a programming language realization. Frond end tool for coding has been selected after analysing. They are:

- Ease of design to code translation
- Availability of development tool
- Maintainability

SYSTEM TESTING

7.SYSTEM TESTING

System testing is the stage of implementation, which is aimed at ensuring that the system works accurately and efficiently before live operation commences. Testing is the process of executing the program with the intent of finding errors and missing operations and also a complete verification to determine whether the objectives are met and user requirements are satisfied. The ultimate aim is quality assurance. Tests are carried out and the results are compared with the expected document. In the case of erroneous result, debugging is done. Using detailed testing strategies, a test plan is carried out on each.

7.1 UNIT TESTING

The software unit in a system is modules and routines that are assembled and integrated to perform a specific function. Unit testing focuses first on modules, independently of one another to locate errors. This enables to detect errors in coding and logic that area contained within each module. This testing includes entering data ascertaining. If the value matches to the type and size. The various controls are tested to ensure that performs it's as required.

7.2 INTEGRATION TESTING

Data can be lost across any interface; one module can have an adverse effect on another sub function. When combined may not produce the desired major functions. Integration testing is a systematic testing to discover errors associated within the interface. The objective is to take unit tested modules and build a program structure. All modules are combined and tested as a whole. Here the client, administration, examination module option are integrated and tested. This testing provides the assurance that the application is integrated functional unit with smooth transition of data.

7.3 VALIDATION TESTING

At the culmination of integration testing, the software was completely assembled as a package, interfacing errors have been uncovered and corrected and a final series of software validation testing program.

7.4 OUTPUT TESTING

At the performing validation test, the next phase is output test of the system. Since no system could be useful. If it does not produce desired output in the desired format. The output format was considered in two ways; one is on the screen and other as a printed form.

7.5 USER ACCEPTANCE TESTING

User acceptance testing is often the final step before giving the product to user. This is actually a black box type testing. User acceptance of the system is the key factor for the success of any system. The system under consideration is tested for user acceptance by keeping in touch with the user. This testing gives the end users the confidence than the application being deliver to them meets the requirements.

SYSTEM IMPLEMENTATION

8. SYSTEM IMPLEMENATION

8.1 INTRODUCTION

Implementation includes all those activities that takes place to convert. From old system to the new. System implementation is the final phase that is, putting the utility into action. Implementation is the state in the project where theoretical design turned into working system. In this stage installation of the package in the real environment, to satisfaction of the intended user and the operation of the system is done, if the implementation of the system is not carefully planned controlled, it can cause chaos and confusion.

8.2 IMPLEMENTATION METHODS

Implementation is the stage in the project where the theoretical design is turned into working system and is giving confidence on the new system for the user that it will work efficiently and effectively. It involves careful planning, investigation of the current system and its constraints on the implementation, design of the method to achieve the changeover, an evaluation of change over methods. The implementation process begins with preparing a plan for the implementation of the system. According to this plan, the activities are to carry out, discussions made regarding the equipment has to be acquired to implement the new system.

Implementation is the final and most important phase. The most critical stage is achieving a successful new system is giving the users confidence that the new system will work and be effective. The system can be implemented only after through testing is done and if it is found working according to the specification.

SYSTEM MAINTENANCE

9. SYSTEM MAINTENANCE

The last part of the system development life cycle, system maintenance, which is actually the implementation of the post- implementation review plan. When systems are installed, they are generally used for long periods. The average life of a system is 4 to 6 years, with oldest application often in use for over 10 years. However, this period of use brings with it the need to continually maintain the system. Programmers/Analyst spend sufficient time for maintaining programs. The maintenance can be classified as corrective, adoption or perfective. Corrective maintenance means repairing, processing or performance failures or making alterations because of previously ill-defined problems. Adoption maintenance means changing the porn functions. Enhancing the performance or modify the programs according to user's additional or changing needs is included imperfective maintenance. The greatest amount of maintenance work is for user enhancement and improved documentation of the system for better efficiency. More time and money are spent on perfective than on corrective and adaptive maintenance together.

Maintenance covers a wide range of activities including correcting coding and design errors, updating documentation and test data and upgrading user support. Many activities classified as maintenance actually fall under enhancements. Maintenance means restoring something to its original positions. Unlike hardware, software does not wear out; it is corrected. In contrast, enhancement means adding, modifying or re- developing the code. To support changes in the specification. it is to keep with the changing user needs and the operational environment.

10.CONCLUSION

The project titled "ASSESS PRO-DIGITAL ASSESSMENT AND FORM GENERATOR" has been developed using PHP (Hypertext Preprocessor) with interactive and user-friendly form controls to ensure smooth operation. This system aims to overcome the limitations of the existing manual process, which is outdated and inefficient. Designed with simplicity in mind, the system can easily be operated by users with basic computer knowledge. It provides a reliable and efficient platform to manage and process internal exam marks, enhancing accuracy and reducing time consumption compared to traditional methods.

APPENDIX

12.1 DATA DICTIONARY

Most of the data elements involved in the internal exam mark system are analyzed and defined by the system analyst to design a solution that effectively manages exam data. Before implementing the system, all data elements and their relationships must be clearly defined and explained. A data element represents the smallest meaningful unit of data relevant to the system, such as student ID, subject name, obtained marks, and grade. These elements are organized into data structures that represent how data flows and is stored within the system. Data flow diagrams can illustrate the movement of data between processes and data stores like files or databases.

12.2 DATA TABLES

TABLE 1

Tabel name: basemark
